

Directional Drilling Services

DIRECTIONAL DRILLING SERVICES

Directional drilling services are provided for the most demanding well trajectories ranging from basic deviation to horizontal wells with a full suite of directional drilling tools and software. CROSCO supplies both conventional and directional drilling assemblies. CROSCO uses adjustable downhole mud motors and Measurement While Drilling (MWD) equipment including directional, gamma and resistivity modules. Mud motors are also used for special vertical drilling applications in order to provide high rates of penetration and significantly reduce rig time and costs. Directional drilling services have been provided onshore since 1954 and offshore since 1972.

CORING SERVICES

CROSCO's conventional and oriented coring services are provided with conventional and special heavy duty core barrels in order to ensure accurate representative reservoir information and to enhance geological and petrophysical models. Oriented coring is provided to add a high degree of certainty in calibrating the data obtained from coring tools.
